

Genes for diagnosing colorectal cancer

Reference cited

1. WO0055351

Field of the invention

This invention relates to genes for diagnosing colorectal cancer, particularly provided a method of clinical diagnosis for colorectal cancer which enables the effects of early diagnosis, specificity, highly sensitivity and safety.

Background of the invention

Colorectal cancer is one of the most common malignant tumors of the world, it is the second most frequent cause of malignant tumor related mortality in developed countries. In developed countries, mortality rate caused by colorectal cancer seems have a descending tendency progressively in previous 20 years, the main causes for early diagnosis is provided and the improvement of methods of therapy and medicines. But in Taiwan the reason of changing in diet habit is occidental habit input and the rapid changing in

environment, the rate of suffering for colorectal cancer is rising constantly, furthermore, also showing an age-descending tendency.

According to top ten related cancer of Taiwanese of 2002, colorectal cancer (CRC) is the third leading cause of cancer-related death for male and female, which is announced by The Department of Health (DOH), highest level of the executive branch, Taiwan. About 6681 new cases of colorectal cancer diagnosed per year such as statistical data by DOH of 1999, for 3649 patients dead in the colorectal cancer per year such as statistical data by DOH of 2002 In Taiwan. The average age of colorectal cancer patient is lower than other countries. In other words, twenty-year-old or thirty-year-old people suffer from the colorectal cancer in Taiwan. Therefore, we can't ignore the possibility of the colorectal cancer caused by young person.

Although methods of diagnosis and surgical operation treatment are improved for colorectal cancer patients, if make a comparison between early diagnosis with later period diagnosis by surgical operation respectively, the treatment is able to probably overcome the colorectal cancer in early diagnosis, but is not able to absolutely overcome the colorectal cancer in the later period diagnosis. The far metastasis are main problem of the treatment for the colorectal cancer, therefore, if a method with highly sensitivity, highly

specificity and easily diagnosis which is able to detect early and potentially curable CRC, We believe that is a novel target for CRC diagnosis and therapy.

The present invention is to provide functional genetic method, for diagnostic genes of colorectal cancer consist of 71 types of genes, that can be applied for early diagnosing possibility of recurrence and metastasis for colorectal patients. Simultaneously, tracing 100 colorectal cancer cases, found that 92% genes variation in colorectal tissue. In the process of tracing for 100 colorectal cancer cases simultaneously, mutation of genes is found in 92% colorectal cancer tissues. In the tracing process, although CEA of 16 patients still in normal value range, that detect early tumor cells in blood by using genes variation testing.

In WO0055351, ROSEN CRAIG A et. al., "Human Colon Cancer Associated Gene Sequences And Polypeptides", disclose colon cancer related polynucleotides and the polypeptides encoded by the polynucleotides herein collectively known as "colon cancer antigens", screening methods for identifying agonists and antagonists of colon cancer antigens of the invention, But, the present invention is to provide SSH and cDNA microarray technology to identify candidate marker genes which are overexpressed

continuously from colorectal proliferous polypus to colorectal oncogene, detecting overexpressed genes are selected from up regulation genes which related intently in colorectal cancer oncogene, and down regulation genes which related in colorectal cancer oncogene. The total 71 genes are used to diagnosing early colorectal cancer.

Summary of the invention

Therefore, the main purpose according to this present invention is to provide the methods of clinical diagnosis for colorectal cancer for early diagnosis, specificity, highly sensitivity and safety.

For the purpose stated above, the gene sequences comprise the steps of: (1) deriving epithelium cells from normal intestines, polypus of intestines and colorectal cancer tissue; (2) collecting genes with highly differential gene expression by Suppression Subtractive Hybridization (SSH), and building library ; (3) deriving colonies with relatively high signal intensities from cancer tissue; (4) collecting more clinically cancer tissues by Northern Hybridization, real-time Polymerase Chain Reaction (PCR) combined with analysis of bioinformation to affirm variation between differential gene expression; and (5) selecting the most suitable genes from said library. Moreover, the reagent

uses the gene sequence as method of clinical diagnosis for colorectal cancer to the early diagnosis.

Brief description of the drawings

The present invention will be better understood from the following detailed description of preferred embodiments of the invention, taken in conjunction with the accompanying drawings, in which

Table 1 is a table showing the result of clinical examination of colorectal cancer biochip;

FIG. 1 is a view showing the procedure of deriving genes according to the present invention;

FIG. 2a and FIG. 2b are views showing the primary screening according to the present invention;

FIG. 3a and FIG.3b are views showing affirmation to genes using Northern Blotting method according to the present invention;

FIG.4a and 4b are views showing quantity expression of cancer tissue according to the present invention; and

FIG.5 is a diagram showing second preferred embodiments according to the present invention.

Description of the preferred embodiments

The following descriptions of the preferred embodiments are provided to understand the methods and the procedures of the present invention. Please refer to FIG.1, showing the procedure of searching genes according to the present invention. Said procedure comprise the steps of: (1) deriving epithelium cells from normal intestines, polypus of intestines and colorectal cancer tissue; (2) collecting genes with highly differential gene expression by Suppression Subtractive Hybridization (SSH), and building library ; (3) deriving colonies with relatively high signal intensities from cancer tissue; (4) collecting more clinically cancer tissues by Northern Hybridization, real-time Polymerase Chain Reaction (PCR) combined with analysis of bioinformation to affirm variation between differential gene expression; and (5) selecting the most suitable genes from said library. Moreover, by using the gene sequence as a reagent, this enables clinical diagnosis for colorectal cancer to the effects of early diagnosis, specificity, highly sensitivity and safety.

The genes for diagnosing colorectal cancer, the specific oligonucleotides sequence are selected from the group consisting of:

We obtain said specific oligonucleotides sequences by using analysis of OMP (Oligonucleotide Modeling Platform, DNA Software, Inc., Ann Arbor, MI) DNA software, Said gene sequences can act as a reagent, a biochip and a medicine for detecting colorectal cancer shown in table 1.

According to the present invention, FIG. 2a and FIG. 2b are views showing the primary screening. FIG.3a and FIG.3b are views showing affirmation to genes using Northern Blotting method. FIG.4a and 4b are views showing quantity expression of cancer tissue. we search over progressive distinctive new genes among the carcinoma process of colorectal cancer by using SSH method to build up CRA libraries and CRC libraries which make the comparison between adenoma, adenocarcinoma and normal tissue, that obtain over 5000 clones in per library; then randomly select about 3000 clones of cDNA from per library to dot on nylon membrane as pre-screen by using Colony Hybridization shown in FIG.2a and FIG.2b. The high expression colonies in colorectal cancer and adenoma are selected by the Colony

Hybridization and then the nucleic acid of cDNA after purification spot on glass chip by using microarray testing.

The expression profiles of the cDNA chips were derived from a set of cDNA probes including adenoma, adenocarcinoma and the corresponding normal tissue from the same patient. Genes exhibiting at least three-fold greater intensities in the adenocarcinoma or adenoma than in corresponding normal tissue samples were considered significant. The significant up-regulated genes were then further confirmed by Northern blot (FIG. 3a and FIG. 3b) and subsequently sequenced. Northern analysis of each set of cDNA genes on the chip revealed that 36 genes were detected as up-regulated in adenoma compared to normal, and 54 genes were detected as up-regulated in carcinoma as compared to the normal control. A set of 23 genes with serial increase of genes expression from adenoma to carcinoma was identified.

Further, comparison is made by using EMBL/GenBank libraries of NCBI/BLAST program, there are 3 unknown functional genes among 23 identified genes including ectopic viral integration site 2B (Genbank accession no.NM-006495) Homo sapiens chromosome 21q22.1 anonymous mRNA sequence (Genebank accession no.AF003738) and Homo sapiens DMR protein mRNA (Genbank accession no.AF327354), and another 20 functional

genes. Among these 20 functional genes, 6 genes are CRC-related (such as TM4SF3), 14 genes are CRC-unrelated (such as ATP2A2). Moreover, we obtain cDNAs of three patients who suffer from adenoma and adenocarcinoma simultaneously and four colorectal cancer patients to affirm variation of 23 identified genes, result shown that were at least 3-fold higher in mRNA expression level in the adenocarcinoma tissues compared with normal samples, and the level gradually increased from colorectal adenomas to adenocarcinomas shown in FIG. 4a and FIG. 4b.

Now, methods of clinical diagnosis for detecting colorectal cancer are fecal occult blood test, image test, tumor label and colonoscopy. In each of these methods, we can generalize purpose of the present invention according to disadvantage of these methods.

1. Early diagnosis

If patient undergo colorectal cancer before tumor cells spread out, five-year survival rate can be achieved over 90%. A certain number of tumor cells are needed for traditional detection by using tumor label method. In the case of image test, normally, correctly affirmation can be made easier when tumor become large. It is high invasion and price to make low acceptance for the patient in the colonoscopy that can not suitable for early diagnosis. Because

of the process of circulating of tumor cells, different expression certainly happen among the genes. In the process of proliferation of early tumor cells, the dying cells cause molecule of ribonucleic acid to release into blood circulation. And, early diagnosis can be offered by the detection of using the constructed oligonucleotide biochip which is discharged from small number of tumor cells in the peripheral blood.

2. Specificity and sensitivity

Fecal occult blood test has shortcomings for high false positives and false negatives to low specificity and sensitivity of the method, therefore the method is merely a first screening tool and the tumor label method is also not high specificity and sensitivity. But, we use these genes to detect peripheral blood of 100 CRC patients, peripheral blood of 50 healthy people and 40 other cancer-related patients as controls shown in FIG.1, these genes can detect 88 colorectal cancer patients for remarkable sensitivity of 88% (88/100) and specificity of 90% (90/100) in the clinical analysis.

3. Safety

The colonoscopy has high invasion and price to make low acceptance for patient in the mass screening tool of early diagnosis. Because sample collection is convenience and low invasion, Peripheral blood test of patient is

a diagnosis method of genes, that is suitable to mass screening clinical application.

Please refer to FIG.5, showing another preferred embodiment according to the present invention. We choose genes of colorectal cancer and vector that express simultaneously in eukaryotic and prokaryotic to form recombination genes, and then form eukaryotic transformant cell by using and further form prokaryotic transfectant cell, and then obtain secreted protein by using extract of genes having said recombination genes, and obtain antibody from said secreted protein immune animals for making of protein testing reagent, colorectal vaccine and colorectal protein medicine for colorectal cancer.

The present invention may be embodied in other specific forms without departing from the spirit of the essential attributes thereof; therefore, the illustrated embodiment should be considered in all respects as illustrative and not restrictive, reference being made to the appended claims rather than to the foregoing description to indicate the scope of the invention.
